FOOTNOTE: Sensor is located at bottom of low flow channel upstream of vertical drop inlet to triple box culvert. The discharge rating table was calculated assuming inlet control hydraulic conditions. The affect of the drop inlet was not considered in the calculations. Therefore, low and moderate flow values are inaccurate. Direct flow measurements are recommended to verify low flow discharges.

Suspect PT vent problem

*Cherry Reservoir
New radio path via Choke path thru July 7
RF problems*

*Ice/snow build-up problem from highway maintenance.
Assumed high water for the year.*

* FOOTNOTE: The water level sensor at this station is positioned 2.3-feet above the box culvert invert to prevent silt blockage. Consequently, low flows are not measured at this site and the reported minimum flow rates should be ignored. Also, the discharge rating used for this station was calculated assuming a clean culvert flowing under inlet control hydraulic conditions. Silt deposits have accumulated inside the culvert and at its entrance resulting in falsely high discharge readings.

Aug. 15 maintenance found PT cap plugged, flush required.

* FOOTNOTE: The water level sensor is positioned 1.1 feet above the channel bottom and 30 feet upstream of the box culvert entrance. Consequently, low flows are not measured at this site and the reported minimum flow rates should be ignored. Also, the discharge rating for this gage was calculated assuming a clean culvert flowing under inlet control hydraulic conditions. A more detailed backwater analysis is recommended to improve discharge estimates.

FOOTNOTE: Sensor is positioned on channel bottom at entrance to box culvert. The box culvert serves as a connecting section to a downstream elliptical concrete pipe. A super-critical concrete channel carries flow to the box culvert. Consequently, hydraulic conditions at this site are difficult to calculate and the corresponding rating table should not be considered accurate.

FOOTNOTE: The water level sensor at this station is positioned 0.9-feet above the box culvert invert to prevent silt blockage. Consequently, low flows are not measured at this site and the reported minimum flow rates should be ignored. Also, the discharge rating used for this station was calculated assuming a clean culvert flowing under inlet control hydraulic conditions. Silt deposits have accumulated inside the culvert and at its entrance resulting in falsely high discharge readings.

Assumed annual peak based on raw data inspection.

* FOOTNOTE: The water level sensor at this station is located in a private pond. Normal pond levels are controlled by flashboards to a depth of 1.2 feet above the crest of a small concrete spillway. The flow rates in the above table assume that the flashboards have been removed. A careful inspection of the raw data is recommended to verify flow rates below 400 cfs.

FOOTNOTE: This new stream gage was installed on August 11 and uses the same sensor ID number assigned to the Wazee Street gage since April 20, 1990. The Wazee Street ALERT gage was discontinued on 2/17/95 as a result of the Greenway Foundation "Punt-The-Creek" project. Water-discharge records have been maintained for Cherry Creek at Denver since August of 1942. The Wazee Street recording gage had been in operation since July 16, 1951. The discharges reported in the above table are based on the Wazee Street rating curve and should be ignored. Also, the reported water levels do not correspond to the Market Street gage heights but do reflect accurate stream level changes for the reporting period.
